

select existing user in view

Description:

An Admin selects a user in the usermanagement view and the usersettings are highlighted.

Precondition:

The user is logged in as an admin and opens the usermanagement tab.

Postcondition:

Inserts the username of the selected user in the username textbox.

The role checkboxes are set to the roles of the specified user and now mark/demarkable to set his new roles, if the acting admin is not the selected user.

Returns:

Returns nothing

Exceptions:

Doesn't throw an exception.

Result:

Inserts the username of the selected user in the username textbox.

Enables the option set the mark/demark the role checkboxes, if the acting admin is not the selected user.

Type:

Systemoperation

References:

updateUser(newRoles)

Comment:

As an admin cannot change his own privileges it is not possible to have no admin.

updateUser(newRoles)

Description:

Sets the roles of the selected user to roles, which are determined by the status of the checkboxes.

Precondition:

The user is logged in as an admin, opens the user management tab, clicks on the button to create a new user, after that fills out the username textbox, marks the checkboxes to determine which roles the new user can have and presses the last button to commit.

Postcondition:

Sets the roles of the selected user in the database to the roles determined by the status of the role checkboxes.

Returns:

Nothing

Exceptions:

Throws no Exceptions

Result:

The roles of a User are changed.

Type:

Systemoperation

References:

select createUserOption

Comment:

A user cannot change his own roles.
